

# OPEN ARCHITECTURE SOFTWARE RUNNING ON LONG-LIFE CONSISTENT HARDWARE

- Corvalent's line of industrial products combined with InduSoft's HMI/SCADA software delivers two fully customizable solutions in one solid package.
- No large upfront costs and shorter time to market. No high software engineer costs or lack of resources, allowing you to stay current with evolving technologies for both hardware and software.
- Corvalent and InduSoft assist by providing an open, non-proprietary platform that can be used as an alternative to in-house development.
- Save time and avoid redeveloping common software and proven hardware solutions already present in Corvalent/InduSoft Web Studio® thanks to low license fees and off the shelf hardware platforms.
- Can provide hardware and software consulting design assistance to develop turn key applications or specific modules.
- You own the Intellectual Property of the application, and are free to take over maintenance of the application. The software is open platform.
- You will not have to incur any cost of keeping the hardware and software current with new operating systems and technology standards. Guaranteed hardware and software compatibility.
- The Corvalent/InduSoft solution provides SDK's (Software Development Kits) that allow for closer integration with the core modules of the software.
- Most OEM's that develop their hardware and software in house do so because they feel they cannot meet their application requirements functionally or economically with off the shelf products. This is not the case with this solution.
- Experience a truly all-in-one hardware and software complete solution.
